Nodes Python Getters

3 min

We need methods to access the data and link within the node. For this, we will use two getters, `.get_value()` and `.get_link_node()`.

These should each return their corresponding value on the `self` object.

Instructions

—

1.

Implement the `.get_value()` getter in the `Node` class.
Hint
Your method should return your node's `value` property.

—

2.

Implement the `.get_link_node()` getter in the `Node` class.
Hint
Your method should return your node's `link_node` property.

script.py

```python
class Node:
  def __init__(self, value, link_node=None):
    self.value = value
    self.link_node = link_node

  # Define your get_value and get_link_node methods below:
  def get_value(self):
      return self.value

  def get_link_node(self):
    return  self.link_node
```
